Business Sales Analysis

2025

Sales Performance & Business Insights

Prepared as a data-driven business performance report covering sales, products, customers, geographic performance, payment methods, discounts, and recommended business actions.

Prepared by Maja Divjak
2025 Sales Analysis

1. Executive Summary

Northstar Retail generated approximately **3.03 million KM** in revenue across **19,985 orders** during 2025. The analysis evaluates overall sales performance, product and category contribution, customer activity, geographic performance, payment methods, and discount usage.

The analysis also identifies key business patterns and provides measurable recommendations that can support future sales monitoring and decision-making.

2. Key Business KPIs

The following indicators provide a high-level overview of Northstar Retail's sales performance during 2025.

Total Revenue	Total Orders	Units Sold
3,029,371.64 KM	19,985	35,064
Average Order Value	Revenue per Unit	Analysis Year
151.58 KM	86.40 KM	2025

3. Sales Performance

Sales performance remained relatively stable throughout 2025, with monthly revenue showing moderate variation. Category-level analysis indicates that revenue is concentrated in a smaller number of business categories.

Monthly Revenue

Key observation: Revenue was highest in **August** at **272.67K KM**, while the lowest monthly revenue was recorded in **February** at **234.55K KM**. The relatively narrow range suggests a stable sales pattern without major seasonal fluctuations.

Revenue by Category

Key observation: Electronics generated the highest revenue at **1.21M KM**, making it the largest contributor to overall sales. Category performance should therefore be monitored separately when evaluating product mix and future growth.

4. Product & Category Analysis

Product-level analysis highlights the difference between sales volume and revenue contribution. This distinction is important when evaluating product performance and prioritizing inventory and sales activities.

Top 10 Products by Revenue

Key observation: **Smartphone** generated the highest product revenue at **664.73K KM**. This product accounted for 804 orders and 1,401 units sold.

Top 10 Products by Units Sold

Key observation: **Wireless Mouse** had the highest sales volume with **5,169 units sold**. Its revenue contribution was **122.49K KM**. The difference between volume and revenue performance shows why both indicators should be monitored together.

5. Customer Analysis

Customer-level analysis identifies customers with the highest total revenue and customers with the highest average order value. These measures provide different perspectives on customer contribution.

Top 10 Customers by Revenue

Key observation: Customer **CUST0387** generated **12.50K KM** in revenue across **47 orders**. Customers with consistently high revenue contribution represent an important group for retention and relationship management.

Top 10 Customers by Average Order Value

Key observation: Customer **CUST0437** recorded the highest average order value at **294.04 KM**.
High-AOV customers may provide opportunities for premium product offers, bundles, or targeted upselling.

Business implication: Total customer revenue and average order value should be monitored together. A customer can generate substantial total revenue through frequent purchases while another customer may generate higher-value individual orders.

6. Geographic Analysis

Sales performance varies across cities. The analysis compares total revenue, order volume, and average order value to identify differences between market size and customer spending patterns.

Revenue by City

Banja Luka generated the highest total revenue with **652,657.77 KM**. This reflects its higher order volume and overall market activity.

Doboj recorded the highest average order value at **155.89 KM**. This shows that the city with the highest total revenue does not necessarily have the highest average customer spend.

Business implication: Geographic performance should be evaluated using both total revenue and average order value. High-revenue markets can indicate strong sales volume, while higher AOV markets may provide opportunities for increasing customer value through targeted offers and product combinations.

7. Discount & Payment Analysis

Payment methods and discount levels provide additional insight into customer purchasing behavior and revenue generation. The analysis compares revenue contribution across payment methods and discount levels.

Revenue by Payment Method

Credit Card generated the highest revenue contribution with **1,339,945.89 KM**. This indicates that this payment method represents a significant part of overall transaction activity.

Revenue by Discount Level

Orders without a discount generated **1,445,619.34 KM** in revenue. The analysis also shows that average order value decreases as discount levels increase.

Business implication: Discounts should be monitored carefully to ensure that they support sales objectives without unnecessarily reducing average order value. Payment method patterns can also help inform customer experience and payment optimization decisions.

8. Key Business Insights

The analysis identifies several patterns that are relevant for monitoring sales performance and supporting future business decisions.

1. Stable overall sales performance

Northstar Retail generated **3,029,371.64 KM** from **19,985** orders during 2025. Monthly revenue remained relatively stable throughout the year, with no extreme concentration of annual revenue in a single month.

2. Electronics is the leading revenue category

The **Electronics** category generated **1,212,669.42 KM**, making it the largest contributor to total revenue. This category should therefore remain an important focus of product and sales monitoring.

3. Revenue contribution and sales volume are different

Smartphone generated the highest product revenue at **664,732.37 KM**. At the same time, Wireless Mouse recorded the highest unit volume with 5,169 units sold. This demonstrates why both revenue and sales volume should be monitored when evaluating product performance.

4. Geographic revenue is driven partly by order volume

Banja Luka generated the highest total revenue at **652,657.77 KM**. Its position is associated with a higher number of orders, rather than having the highest average order value. This distinction is important when comparing markets.

5. Higher discount levels are associated with lower AOV

The analysis shows that average order value decreases as discount levels increase. This is an observed association within the dataset and should not be interpreted as proof that discounts directly cause lower order values.

9. Recommendations

Based on the observed sales patterns and business metrics, the following actions can support revenue growth, customer value, and more consistent performance monitoring.

1. Prioritize high-value products

Maintain strong availability and visibility for products that generate a significant share of revenue. Product-level revenue should be monitored regularly to identify changes in demand and contribution.

2. Monitor revenue and sales volume together

High unit volume does not necessarily correspond to the highest revenue contribution. Product decisions should therefore consider both units sold and revenue generated.

3. Focus on increasing Average Order Value

Use product bundles, complementary products, and targeted cross-selling opportunities to increase the value of individual customer orders without relying exclusively on discounts.

4. Use discounts selectively

Because higher discount levels are associated with lower average order value in the dataset, discounts should be targeted toward specific commercial objectives rather than applied broadly. Their impact should be monitored using revenue, order volume, and AOV.

5. Monitor geographic performance

Track both revenue and AOV by city. High-volume markets can be managed for scale, while markets with higher AOV may provide opportunities for increasing customer value through targeted campaigns and product combinations.

6. Establish regular KPI monitoring

Create a monthly reporting process covering revenue, orders, AOV, units sold, category performance, discounts, and geographic performance. Regular monitoring will make it easier to identify changes early and evaluate the impact of business actions.

10. KPI Targets & Next Steps

The following targets are proposed management objectives for future performance monitoring. They are not forecasts and are not directly derived from the historical dataset.

KPI	2025 Result	Proposed Target
Total Revenue	3,029,371.64 KM	3.33M KM (+10%)
Total Orders	19,985	21,000+
Average Order Value	151.58 KM	160+ KM
Units Sold	35,064	37,000+
Electronics Revenue	1.21M KM	+10%
Discounted Revenue Share	52.28%	≤ 50%
Monthly Revenue	234.6K–272.7K KM	≥ 250K KM
Critical Data Quality Issues	Multiple issues identified	< 1%

Recommended Next Steps

- Establish a monthly sales KPI review using the metrics in this report.
- Monitor product revenue and unit volume to identify changes in product performance.
- Review discount performance regularly and compare discount levels with AOV and revenue.
- Track city-level revenue and AOV to identify opportunities for market development.
- Improve data-quality controls for critical transaction fields.
- Use the 2025 results as a baseline for evaluating future performance.

11. Final Conclusion

Northstar Retail generated **3,029,371.64 KM** in revenue from **19,985** orders during 2025, with an average order value of **151.58 KM**.

The analysis identified **Electronics** as the largest revenue-generating category, while **Banja Luka** generated the highest total revenue among the analyzed cities.

The results indicate that future performance monitoring should focus on revenue growth, Average Order Value, product-level performance, geographic differences, and disciplined use of discounts.

A structured monthly KPI review, combined with improved data-quality monitoring, can provide a consistent basis for evaluating business performance and measuring progress against the proposed management targets.
